## Information Sheet for Residents in Assisted Living

### About Helpany:

At the heart of Helpany 's product is a radar-based device called Paul, ingeniously designed to analyze motion patterns of residents, to let caregivers and residents spot an increased risk of falling and other health-related issues early on. Paul passively measures multiple well-being indicators such as gait speed, sedentary behavior or steps walked, restlessness at night and summarizes them in a frequent report (Health is Wealth Report).

**About the Health is Wealth Report:** A frequent one-page summary of relevant health statistics based on the measured nocturnal restlessness, daily sedentary behavior, and average pace of movement is distributed directly to the residents.

**About the Smart Night-Light:** The smart nightlight is designed to enhance the safety of the living space. Paul is intended to respond to movement at night and aims to light up automatically, providing a sense of orientation in the dark and thereby better mitigating fall risks. The nightlight is by default only active in the living room but can also be activated for the bedroom. The resident can ask the facility to activate and deactivate the nightlight also in the bedroom.
